Symitar EASE™

Hosted Environment of the Symitar® Core Processing Platform

Have you considered how easy hosting your core platform in the private cloud can be?

Driven by the need to lower costs, increase efficiency, save money, and reduce risk, credit unions are setting their sights on a hosted solution as an alternative delivery model. Each credit union's culture and strategy determine whether it uses in-house deployment or the private cloud environment for its core processing system. For credit unions leaning toward a hosted core, Jack Henry™ can get you there with EASE.

benefits of a hosted infrastrucure and more

With EASE, credit unions benefit from an extensive infrastructure, sophisticated processing environment, and the latest IBM technology. Infrastructure and operational processes are in place allowing your credit union to seamlessly move between data centers, eliminating both the capital expenditures required for in-house installations and the need for employee resources to operate and manage in-house hardware and software. And, as ransomware and cybersecurity remain top of mind for all executive teams, another benefit EASE offers is disaster recovery and avoidance in addition to providing secure access to the Symitar core processing platform.

At-a-Glance

Business Value

- Saves Money
- Improves Operations
- Reduces Risk

Compatibility

- Symitar®

the power of Symitar without the added legwork

EASE provides credit unions the ability to focus on their core competencies with seamless access to advancing technology, strict regulatory compliance, and ongoing access to industry, technology, and security experts. Using EASE, credit unions can quickly introduce new member- and market-driven products and services. They also have on-demand access to more than 50 integrated complementary products and services. Additionally, a hosted deployment means that credit unions receive the full benefit of ongoing, client-driven enhancements to Jack Henry's core processing system.

put the focus back where it belongs

If a credit union later decides to transition from a hosted to in-house deployment, this process can be handled without conversion. Instead of focusing on loading operating system updates, firmware updates, and managing system maintenance and release loads, EASE enables credit unions to reallocate IT resources and focus on core competencies while serving members and delivering on projects that impact your financial bottom line. In addition, EASE clients also have a dedicated customer relationship manager as a single point of contact for inquiries and service.
